I'm an applied AI engineer in Ottawa and have worked across software, data and machine learning since 2022. At EventLinx I'm the main engineer on the AI platform, where I built the agents, integrations and testing the team relies on. I've also led data projects from pipeline to Power BI dashboard. I build with Claude Code and Cursor every day: 2,000+ commits across 7 repos, a 90-day shipping streak, and I test what the agents build the way a user would.

Skills

Languages	Python, TypeScript, SQL, JavaScript
AI & LLMs	LLM agents, tool calling, MCP, RAG, LangGraph, LangChain, Azure OpenAI, Microsoft Foundry
Evaluation	LLM judges, promptfoo, red-team testing, regression testing, A/B model comparison
Machine Learning	PyTorch, scikit-learn, XGBoost, LightGBM, Prophet, model tuning
Computer Vision	YOLO, SAM2, ResNet, DETR, OpenCV, OCR
Data & Databases	PostgreSQL, SQLite, NoSQL, data modelling, ETL with Pandas and PySpark, Power BI, BigQuery
Backend & APIs	FastAPI, REST APIs, webhooks, Twilio, SendGrid, Slack
Cloud & DevOps	Azure, AWS, Google Cloud, Cloudflare Workers, Docker, GitHub Actions, Azure DevOps Pipelines
AI Tools	Claude Code and Cursor daily (60M+ tokens a month), up to 7 agents in parallel

Experience

Lambton College × EventLinx

AI Research Technician / AI Specialist

Sarnia, ON (remote)

Feb 2026 - Present

Main engineer on EventLinx's AI platform, working with the co-owners and technical lead. Built and launched a WhatsApp agent that lets promoters create events, set up ticketing and check sales by chat, in English and French (Cloudflare Workers, Twilio, Azure OpenAI). Promoters can send a voice note or an event poster instead of typing, the agent remembers each promoter across conversations, and it generates event artwork for them to approve or revise.

Built a 45-tool MCP server that connects the agents to the company's PostgreSQL database (TypeScript). Every database change waits for the user's confirmation, which stopped unapproved changes and cut worst-case reply time by about 70%. Added a check that blocks values the model made up, and moved date and time-zone handling into code after live tests showed times saved 4-5 hours off.

Set up testing for every release: LLM-judged test conversations, red-team tests and 2,000+ automated tests in CI. Found and fixed a memory-poisoning security issue through red-team testing. Kept gpt-4.1-mini over gpt-5.4-nano after an A/B test in which it passed 35 of 36 test cases against 25.

Developed the seating-chart vision models end to end. Worked on synthetic seat-map generation and built the training data around it: COCO dataset generation, a browser labelling tool and 20+ seat maps labelled by hand. Trained and fine-tuned a YOLO11 detector and a custom ResNet18 CNN seat-type classifier in PyTorch on a Lightning AI T4 GPU, with SAM2 for segmentation, then benchmarked them on 250+ real venue maps and 1,000+ synthetic maps and analysed the errors on noisy layouts.

Replaced those models with one Azure OpenAI service when testing showed it hit the expected seat counts on all 5 test venues at a median cost of \$0.91 per chart. Rebuilt the service in TypeScript on Cloudflare Workers, which ended its cold-start failures, and cut its cost with a per-request budget cap after finding reasoning tokens were most of the spend.

Built an email agent that drafts support replies for staff to approve in Slack, and set up the dev, staging and production release pipeline in Azure DevOps Pipelines.

Algonquin College Applied Research

AI Research Assistant

Ottawa, ON

Apr 2025 - Dec 2025

Led a research team writing AI proposals for emergency medical services with 5+ government stakeholders. Wrote evaluation plans and technical roadmaps for the AI pilots, including privacy-preserving analytics, and secured an initial \$150K funding commitment through Mitacs, NSERC ARD and Horizon Europe proposals.

Infidata Technologies

Python Application Developer

Bengaluru, India

Mar 2022 - Jun 2022

Built an event-driven ETL on AWS Lambda and RDS that saved about 40 hours a month of manual QA, and ran blue-green deployments with AWS CodeDeploy with no downtime across 12 releases.

Projects

- **FutureCanada** (Algonquin College capstone with IRCC, lead contributor, Jan-Apr 2025): forecast how immigration affects housing and education demand to 2035. Led the data engineering and built the Python pipeline, where Prophet beat RandomForest and XGBoost in 8 of 9 regions (Ontario R^2 0.965), and built the Power BI dashboard.
- **Malware Classifier** (CSE Canada capstone, team lead, Jan-Apr 2024): LightGBM on 8M+ records, chosen over Logistic Regression, Random Forest and XGBoost. It matched published benchmarks and shipped as a Windows command-line tool that checks 10,000+ executables an hour.
- **Hasten** (personal, sole developer, 2026): an offline phone app that captures and plans ideas by voice or text, built with Claude Code (React Native, SQLite, 325 automated tests).
- **BogdAI** (Microsoft Agents League Hackathon 2026, team): wrote most of the backend for a six-agent contract reviewer on Microsoft Foundry.
- **AI for Regulatory Compliance** (personal): a multi-agent RAG system in LangGraph that flags compliance gaps and creates or updates Jira tickets.
- **Churn Intelligence Agent** (personal): a churn model (XGBoost with BERT sentiment, 85% AUC) paired with a LangChain agent that suggests retention actions.
- **SceneSense** (personal): a Hugging Face demo that detects objects in images and reads the scene aloud in 8 languages.

Education

Algonquin College

Post-Graduate Certificate, Business Intelligence Systems Infrastructure

Ottawa, ON

2025

Algonquin College

Post-Graduate Certificate, Artificial Intelligence Software Development

Ottawa, ON

2024

Presidency University

Bachelor of Technology, Electronics & Communication Engineering

India

2022

Certifications & Community

- Certifications: AI Applications with Azure; Generative AI with OpenAI (DeepLearning.AI); DevOps Foundations.
- AI/MLOps writing (5,000+ readers a month); admin of a 600+ member AI-careers Discord.
